Human Wildlife Conflict and Likelihood to report the loss: A Case Study of Nepal

Gita Bhushal Adhikary, Pankaj Lal, and Bernabas Wolde Department of Earth and Environmental Studies, Montclair State University

Introduction

- ➤ Globally, approx. 6 million sq. miles of land are allocated for national parks (Gray et al., 2016; Melillo et al., 2016)
- > 300-350 million people living within or nearby parks (World Wildlife Fund, 2018)
- > Proximity causes heightened human-wildlife conflict (Peterson et al., 2010)

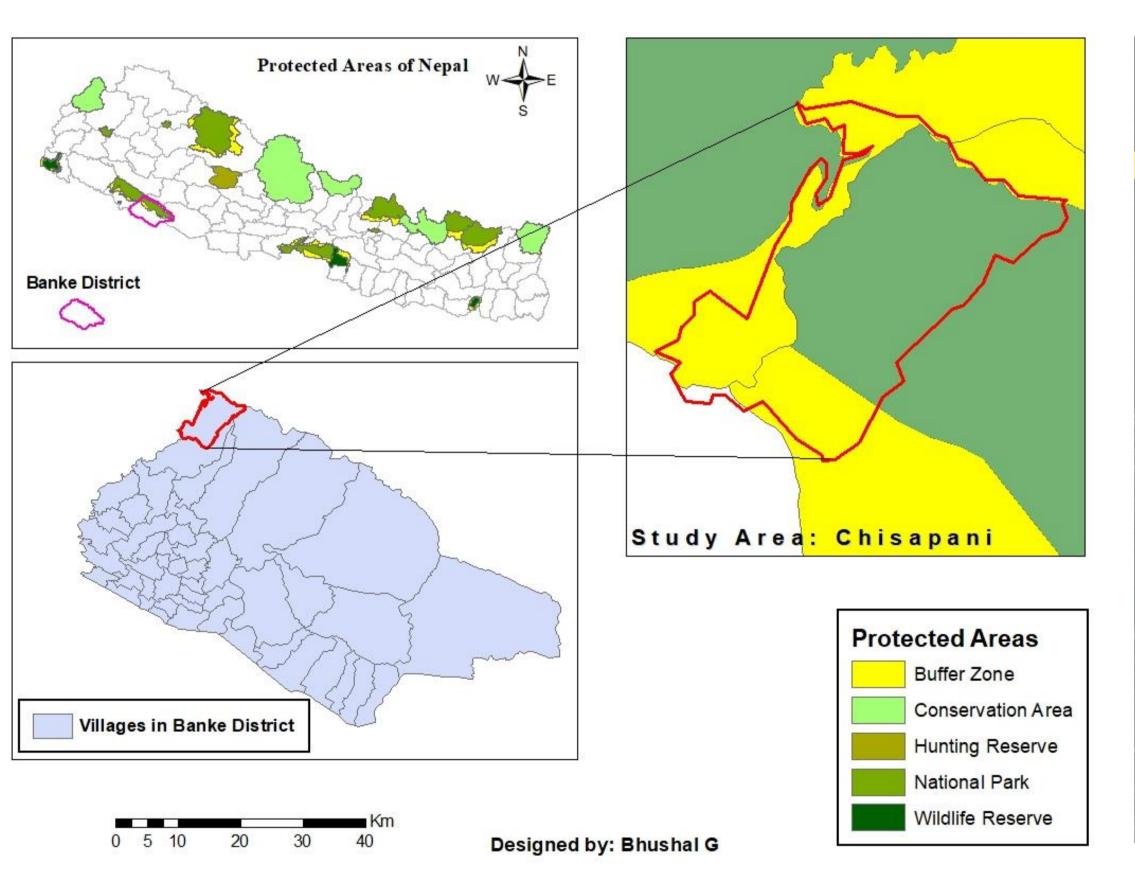

Rationale

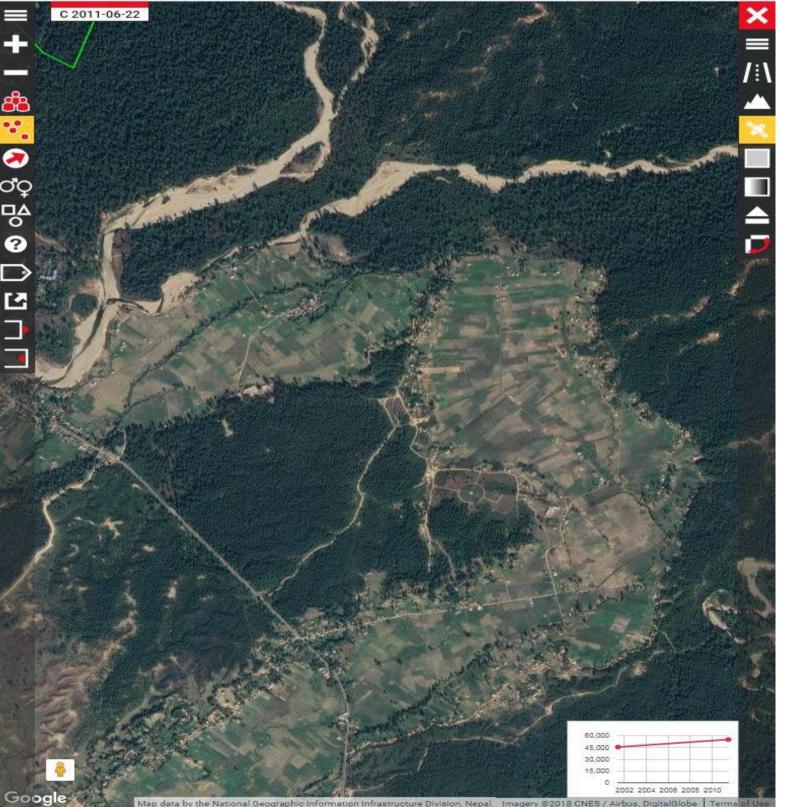

- > Compensation schemes: ex-ante or ex-post (Boitani and Raganella, 2010)
- > Schemes have been largely ineffective (Madhusan 2003)
- > People choose not to, or are unable to, report their loss

Objective

To explore the factors influencing the likelihood to report the loss from wildlife

Study Area

Methods

- ➤ In-person survey included:
 - Part I: Socio-demographic background of respondents
 - Part II: Experience of human wildlife conflict
- > 197 households were randomly surveyed
- > IRB Approval # IRB-FY16-17-649
- Survey date: July, 2017

Theoretical Framework

- ➤ Dependent variable (Y): "whether the respondent has reported a loss after experiencing human-wildlife conflict"
- \triangleright The probability of a "yes" response was estimated given the independent (X) variables as:

$$\pi(x) = Probability (Y = 1|X = x) = \frac{e^{\alpha + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_n x_n}}{1 + e^{\alpha + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_n x_n}}$$

Results

> All respondents reported crop loss, and about 60% reported livestock death

Table1: Logistic Regression showing only significant variables

Variables	Coefficient (β)	Standard Error (SE)	Level comparisons
Age	1.63**	0.65	30-39 vs 20-29
	-0.99	0.54	40-49 vs 30-39
	0.56	0.68	50-59 vs 40-49
	-1.45	0.79	≥60 vs 50-59
Gender	-0.53**	0.26	Male vs Female
Family size	0.65	0.71	4-6 persons vs 1-3 persons
	1.14***	0.43	≥7 persons vs 4-6 persons
Common Leopard	0.83**	0.34	Yes vs No
Bengal Tiger	0.63***	0.22	Yes vs No
Asian Elephant	0.58**	0.27	Yes vs No

Note: ***and ** indicates significance at α =0.01 and α =0.05 respectively

Conclusions and Policy Recommendations

- ➤ Statistically significant variables from Table 1 were likely to influence the likelihood to report the loss
- ➤ Age 20-29 population and males in the community should be targeted while disseminating the information about compensation scheme
- The compensation scheme should also consider deer, monkey, porcupine, black buck, and wild birds rather than being limited to the current eligible species

Future Work

This research could be expanded to include other parts of the country, and other developing countries that experience challenges with conservation areas
