Ferrate: a novel water treatment input

WHEN: September 24, 4:00 pm  WHERE: CELS 120 lecture hall

Joseph Goodwill, PhD, PE, LEED-AP
University of Rhode Island

Dr. Goodwill is an Assistant Professor of Environmental Engineering at the University of Rhode Island, in the Department of Civil & Environmental Engineering. In that position he executes research, teaching, and service focused on strengthening water systems. He has also worked as a consulting engineer, and volunteer on international water development projects.

Advanced oxidation processes (AOPs) are effective at transforming recalcitrant organic water pollutants. However, most AOPs require relatively complex and capital intensive auxiliary systems to generate radicals. Ferrate (Fe(VI)) is a strong oxidant that affords an operational simplicity that some utilities require. This presentation will provide an overview of Fe(VI) technology, and recent results of an ongoing study focused on Fe(VI) and water reuse.
