Coastal hazards affect both human and natural systems in ways that can be sudden, dramatic, and/or irreversible. Flooding, erosion, and landscape change, driven by storms, sea-level rise, and human disturbances present a variety of challenges for those living and working on the coast. The U.S. Geological Survey (USGS) delivers a variety of products and tools that support the mitigation of coastal hazards, including protecting life and property. Our Coastal Change Hazards (CCH) programmatic focus was born from a goal to better serve communities’ needs using the best science available to support effective coastal management and inform decision making from local to national scales. The CCH focus integrates stakeholder engagement, public communication, and technical needs with traditional research expertise and external collaborators to continuously align federal priorities with science and products most beneficial, relevant and useful to our coastal communities. This presentation will feature several examples of co-developed research and engagement efforts that are part of CCH.
